

Typically we give text and logos a low priority versus other details on the part design. We assume that text and logos are a known detail and the testing is a form fit and function test of the part design. It becomes very important to notify us up front on the importance for any text or logos to show up clear and distinct. Also, we recommend at the very least all lettering and logo details are .020" tall and .020" thick in all places. Otherwise you may get partially built text and lettering.
